Dear Mr. Davis,

This letter reports landfill gas data collected at Terrace Heights Landfill, Cheyne Landfill, and the Closed Snipes Mountain Landfill[1] on September 15th, 16th, and 17th 2025 (2025 Q3).

1 Summary

- Methane concentrations exceeded 5% by volume (the lower explosive limit, LEL) at Terrace Heights in perimeter probes GP-4D (32.9%) and GP-11S (5.4%). The exceedances are consistent with previous sampling events. Exceedances are being addressed by Yakima County in consultation with the Yakima Health District and Department of Ecology with the installation of a new gas extraction system.

- Methane concentrations exceeded the LEL at Cheyne Landfill at interior probes GP-3D (14.4%) and GP-8-2 (6.1%) The exceedances are consistent with previous sampling events. Exceedances are being addressed by Yakima County in consultation with the Yakima Health District and Department of Ecology with the installation of a new gas extraction system.

- Methane concentrations exceeded the LEL at Snipes (Lower Valley Transfer Station) at GW-4 (7.6%), GW-5 (9.9%), GW-8 (9.2%), and GW-9 (7.3%).

2 Landfill Gas Results

All gas probes sampled by Mott MacDonald were purged with a portable hand pump immediately prior to sampling. The purge volume was a minimum of three times the casing volume. Each probe was sampled for methane, oxygen, and carbon dioxide volume percent using a Landtec GEM 5000 gas meter.

[1] Formerly referred to as the *Lower Valley Transfer Station (LVTS)*

2.1 Terrace Heights Landfill

Background

Landfill gas monitoring at Terrace Heights includes 25 probes in 11 separate monuments (Figure 1, Table 1), 22 of which are monitored quarterly. Probes at locations GP-1 to GP-8 were installed in 1995. On November 5, 2010, additional perimeter probes were added to the monitoring network at locations GP-9, GP-10 and GP-11.

Southern boundary probes include GP-1S, GP-2S & D, GP-3S, M, & D, GP-5M & D, GP-6M & D, GP-7S, and GP-8M & D. Probes GP-6M, GP-6D, and GP-7S are only monitored if methane at GP-3 exceeds 2.5% in any interval. Other perimeter probes include GP-4S, M & D, GP-9S, M & D, GP-10S, M & D, and GP-11S, M & D.

Along the southern boundary there is a gas extraction system. Twelve gas extraction wells at six separate locations (A-1 to A-6) were installed at the southern end of Terrace Heights in October 2003 (Figure 1). Gas extraction commenced on April 6, 2005. Prior to the operation of the gas control system, 1995 through 2005, methane was present above LEL along the southern boundary of the landfill (Figure 2)[2]. Due to the gas extraction system, methane concentrations in gas probes along the southern property declined (April 2005 through December 2006) and were consistently below the LEL. In response to this decline, Yakima Health District approved a request to discontinue quarterly monitoring at GP-6 and GP-7[3] (Yakima Health District, 2011).

Methane was detected above the LEL in southern boundary probe GP-2S (15.5% and 28.1%) during the 2023 Q2 and 2023 Q4 sampling events, respectively. Yakima County moved to daily monitoring along southern gas probes on February 22, 2024. A Remedial Action Plan was submitted to the Yakima Health District on March 1, 2024. SCS Engineers performed maintenance on the gas control system March 27, 2024. The expanded gas extraction system was completed and went online on April 16, 2025. To date, there have been no methane detections in offsite residences, and maximum concentrations in both GP-2S and GP-2D show decreasing trends (Figure 3). Yakima Health District approved discontinuing the offsite residence monitoring on May 14, 2025, returning to quarterly monitoring for southern boundary gas probe clusters GP-1, GP-3, GP-5, and GP-8 on September 9, 2025, and returning to quarterly monitoring for GP-2S and GP-2D on October 28, 2025.

Methane concentrations at GP-11S increased between 2011 through 2017, measuring above 19% in 2016 Q2 and 2017 Q3, then decreased with intermittent LEL exceedances (Figure 4). Concentrations at GP-11S began increasing again in 2022 Q4 and have exceeded the LEL for the previous nine sampling events, but concentrations have not reached the higher concentrations measured between 2016 Q2 and 2017 Q3. Concentrations at GP-4S, M & D have varied above and below the LEL several times since 1996, with an overall increasing trend, and more consistent exceedances of the LEL with large fluctuations since 2018 (Figure 4). Yakima County installed passive gas vents GV-1 through GV-6 in January 2012 to mitigate landfill gas migration at the northern property boundary (Figure 1). Continued exceedances along the northern landfill boundary indicate that the passive vent system has not mitigated LFG migration at the northern boundary.

Results

The 22 gas probes were measured on September 17th, 2025 (Figures 2-4). Key results include (Table 1):

- Methane was detected above the LEL in perimeter probes GP-4D (32.9%) and GP-11S (5.4%)
- Methane was not detected in southern boundary probes GP-1S, GP-2S, GP-3S, GP-3M, GP-3D, GP-5M, GP-5D, GP-8M, or GP-8D.

[2] The spike in the June 2000 sampling event is a potential outlier measurement.

[3] Quarterly monitoring will resume at GP-6 and GP-7 if methane is detected above 2.5% at any of the GP-3 probes or if the gas extraction system is shut down for a month or more.

Mott MacDonald Restricted

As discussed above, the methane detections above the LEL during this quarter are consistent with past measurements and are known conditions. Yakima County completed construction on an expanded gas extraction system that went online on April 16, 2025 and is designed to mitigate LFG migration sitewide.

2.2 Cheyne Landfill

Background

Monitoring at Cheyne Landfill includes 16 probes in 8 separate monuments (Figure 5), 12 of which are monitored quarterly. Three of the eight monuments were added in July 2007, shown on Figure 5 as GP-6, GP-7, and GP-8. The northernmost probes GP-6-1[4], GP-6-2, GP-7-1, GP-7-2 are measured annually in the current monitoring program and have not had any detections of methane to date. Probes at locations GP-2 and GP-3 are in the interior area of the Cheyne property and are not perimeter locations.

Detections above LEL at perimeter gas probes GP-8-1 and GP-8-2 in March 2012 were the first exceedances at those gas probes. Yakima County submitted a Remediation Plan to Yakima County Health to address subsurface methane near GP-8, which was approved on July 31, 2012. Methane exceeded the LEL in GP-8-1 and GP-8-2 again in June 2015 and Yakima County began the collection of verification samples according to the Remediation Plan. Verification sampling was concluded on September 29, 2015, and confirmed exceedance according to the criteria outlined in the Remediation Plan. Yakima County notified the Health District of the confirmation of exceedance in an email dated October 15, 2015, and is installing an extraction system to address the exceedances in communication with the Health District. The extraction system is running with only the condensate system potentially incomplete as of November 3, 2025. Maximum methane concentrations at gas probes GP-8-1 and GP-8-2 appear to be gradually increasing over time (Figure 6).

The time series plot of methane concentrations at Cheyne (Figure 6[5]) shows that levels above the LEL have been present in the landfill since the late 1990s southeast of the refuse as indicated by concentrations at GP-3S and GP-3D. The methane concentrations in GP-3S and GP-3D have been gradually increasing over time and are intermittently (GP-3S) and consistently (GP-3D) above the LEL. Concentrations at GP-3S and GP-3D appear to have plateaued around 15% and 40%, respectively, and appear to have started to decline in the last three years. Concentrations at GP-2D, also on the southeast of the refuse, have been intermittently above the LEL and with less consistency after 2012. Probes at locations GP-2 and GP-3 are in the interior area of the Cheyne property and are not perimeter locations.

Results

All 12 probes were monitored on September 16th, 2025 (Figure 6). Key results include (Table 2):

- Methane was detected above the LEL in perimeter probe GP-8-2 (6.1%).
- Methane was detected below the LEL in perimeter probes GP-1D (1.8%) and GP-8-1 (0.1%).
- Methane was detected above the LEL in interior area probe GP-3D (14.4%).

Yakima County is currently implementing a mitigation approach to address LFG migration sitewide.

2.3 Closed Snipes Mountain Landfill

Background

Six gas probes (in three separate monuments), 10 wells in the passive gas collection system, and a flare are sampled quarterly at the Closed Snipes Mountain Landfill (Figure 7, Table 3).

[4] These gas probes use a different naming system where GP-6-1 and GP-6-2 indicate the shallow and middle screened intervals, respectively. The -1 and -2 suffixes refer to the port numbers on the top of the Solinst CMT casing.

[5] The spike in the June 2000 sampling event is a potential outlier measurement.

Mott MacDonald Restricted

Results

The six probes and 10 gas wells were monitored on September 15th, 2025. Key results include (Table 3):

- Methane was detected above the LEL in passive collection wells GW-4 (7.6%), GW-5 (9.9%), GW-8 (9.2%), and GW-9 (7.3%).
- Methane was detected below the LEL at the flare (0.5%)[6].
- Methane was not detected in any of the probes.

Methane has not been detected above the LEL in any of the gas probes to date (Figure 8).

2.4 Continued Sampling

Gas monitoring probes at Terrace Heights, Cheyne, and Closed Snipes Mountain Landfills, as well as the passive collection system and flare at the Closed Snipes Mountain Landfill will be sampled again in November 2025.

Please feel free to call if you have questions.

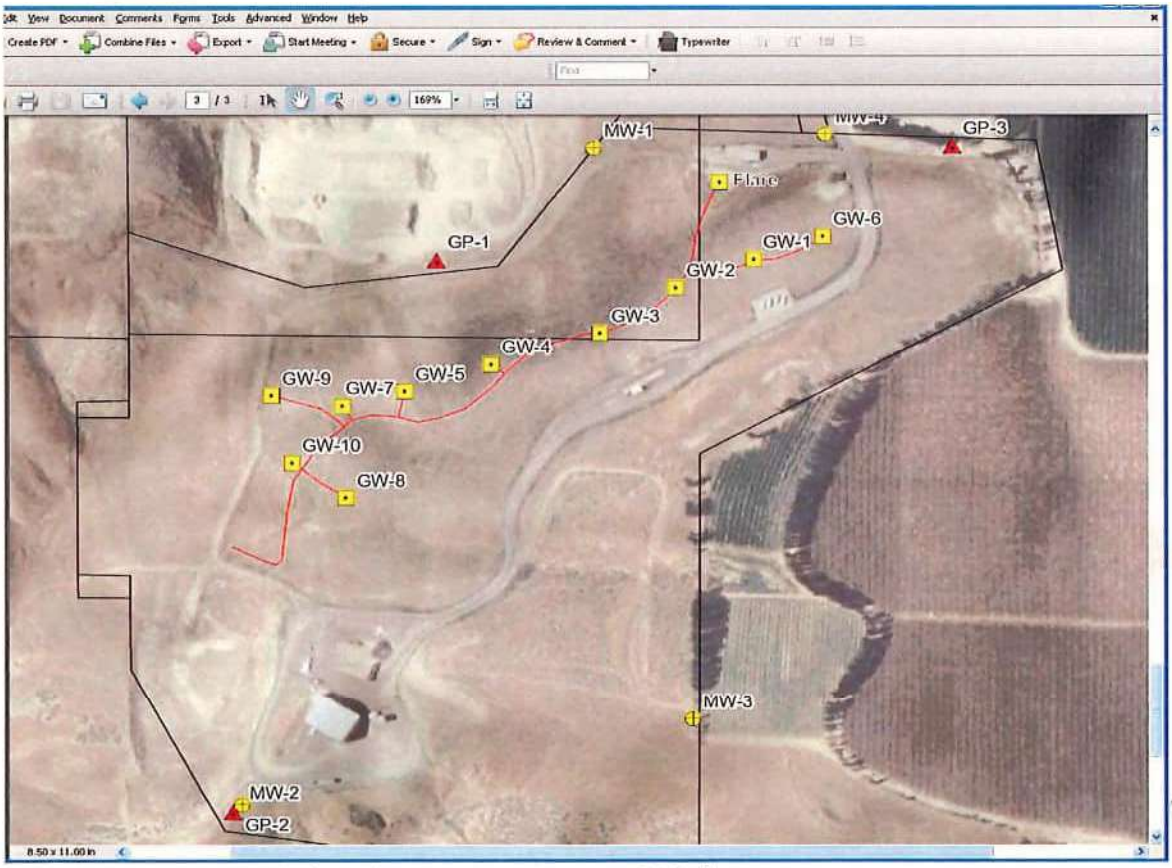
Flare operating Unknown.

Barometric Trend: ~~Stable at 29.11~~ Decreasing

Flare Ignition (is click audible?): no

Notes:



SMW-3 9/15/2025 285.00 - 2.39

Water Level - 282.61

SMW-4 9/15/2025 - DRY
